Outline

- Background:
 - SKA / MeerKAT
 - SKA SDP
- Regional Centres
- Scheduling Data Transfers
- Components
- Architecture Overview
- Status

SKA

- Square Kilometre Array
 - To be the world's largest radio-telescope
 - Global collaborative effort
 - Hosted in South Africa & Australia
- BIG data
- Currently in design phase
 - Aim start construction in 2018/2019

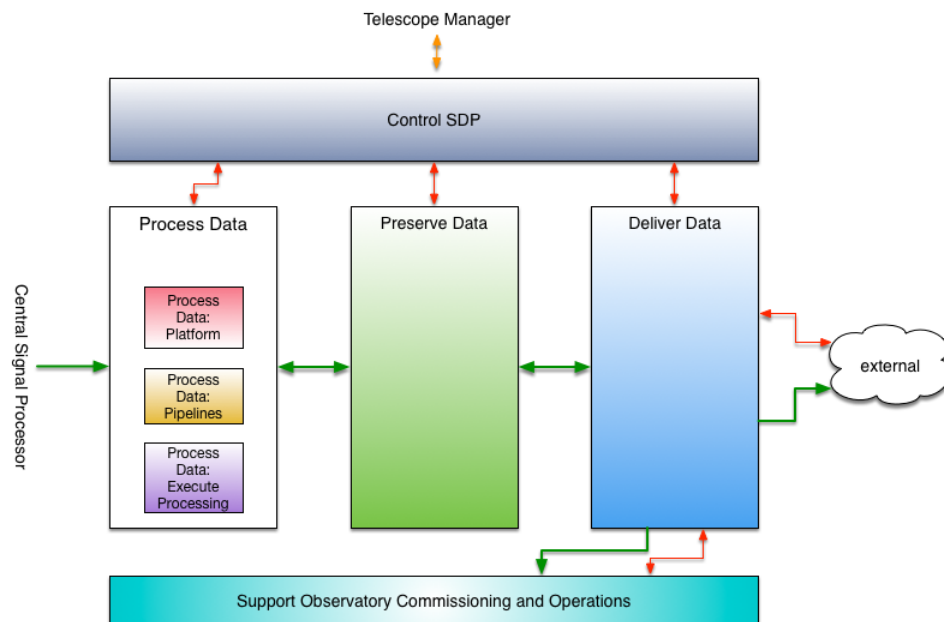

MeerKAT

SKA Science Data Processor (SDP)

- One of several SKA work packages
- Science Data Processor
 - Receive data from correlator
 - Produce / store Science Data Products
 - Deliver Science Data Products
- Delivery only to observatory staff and SKA Regional Centres

Regional Centres

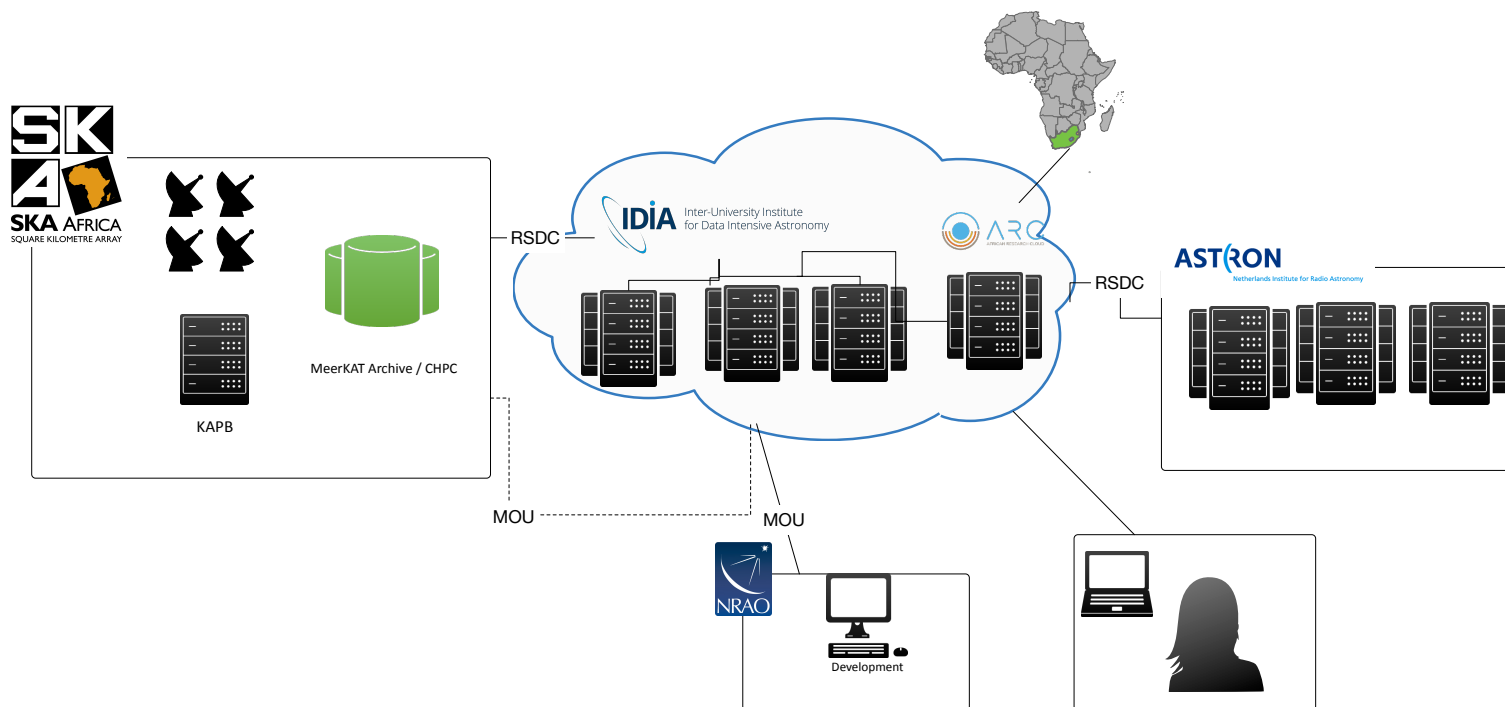

- Scientists working on SKA data will be distributed
 - (so are the funding agencies)
 - Minimize latency to data being worked on
- Further processing of products required before in final state for analysis
 - SDP throughput must keep up with input data
 - Scope limits prevent certain types of derivative data products being created
 - Projects will produce more data than could be stored in the archive
- Data volumes are too large to send direct to end users

Why schedule data transfers?

- Allows priorities to be set on which data is moved next
 - Adhere to user/project resource allocations
 - Avoid starvation
- Manage network to maximize performance
 - Handle congestion – particularly on long-distance links (ASTRON)
 - Ensures that WAN is kept busy by keeping data in flight
 - Use efficient WAN data transfer protocols
- Allows checks to see if data is available at other locations
- Support subscriptions to datasets

MeerKAT

DOME project: IBM / IDIA / ASTRON / SKA-SA

Getting data

- *Query*
 - *CADC supplying packaged set of IVOA services*
- Request: Get a (set of) data product(s)
 - Also includes subscription support
- Prepare: Preprocessing – e.g. region extraction, averaging
- Deliver: Ship the data

- Request / Prepare / Deliver:
 - Focus of the DOME Delivery Service

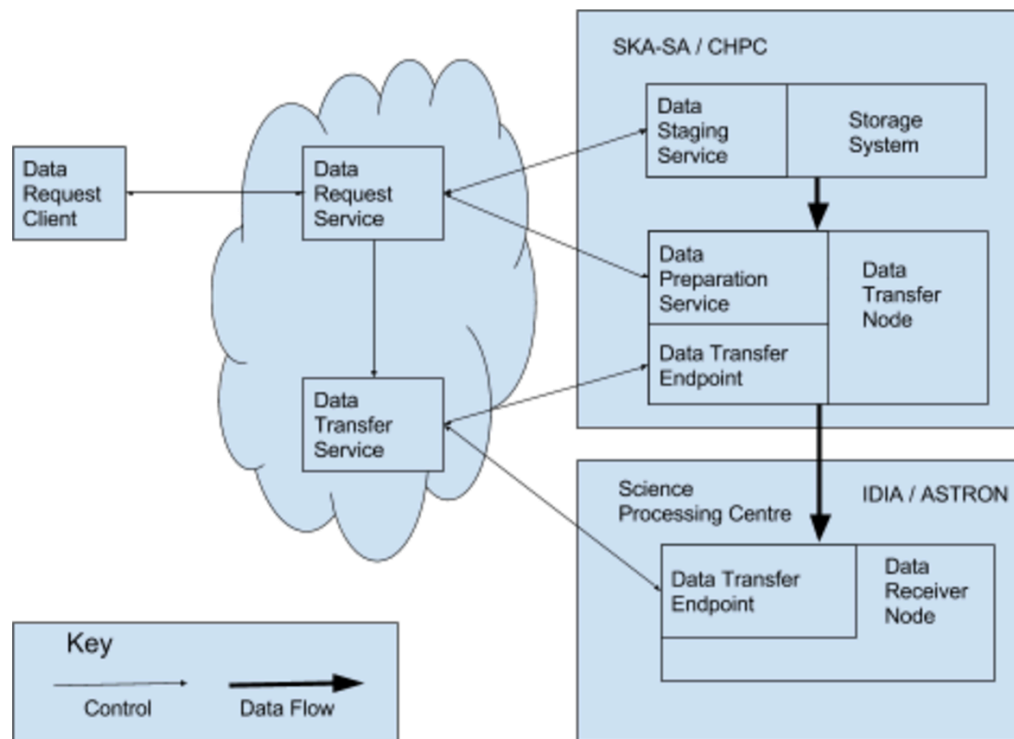

Transfer Components

- Transfer Service: The central service
- Stager: Copy product from archive to scratch space on a transfer node
- Node Agent: Perform preprocessing; Assist in managing data

- Integrated:
 - FTS – using GridFTP for transfers

- Security: X.509

Transfer Tool Overview

Status

- Operational prototype of the transfer service
- Query service: expecting the delivery of CADC Query service docker images in near future
 - Integration required
- Testing
- Expansion to meet the needs of the SKA

A photograph of a radio telescope array at night. The sky is dark and filled with stars, with a faint glow on the horizon. Several large, white, parabolic radio telescope dishes are visible, some in the foreground and others in the distance. The foreground is dark and appears to be a desert or a similar arid landscape.
